Bed Bugs and Birds

**The Dawning of the 50s:**

The 50s decade was known for many things: post-war consumerism, rock and roll music, television shows like "I Love Lucy" and "The Honeymooners," and the beginning of the "Space Race." Buildings were constructed with more glass, reflecting the modernist architectural style of the time. The 1950s also witnessed the beginning of the "baby boom," with millions of Americans born during this decade.

**History of Bed Bugs:**

Bed Bugs have been studied and documented throughout history. In the 19th century, they were known to be carried by slaves and introduced to the Americas. The first recorded case of bed bugs in the United States was in 1869. By the 1950s, DDT was introduced to exterminate cockroaches and other bugs, and bed bugs were thought to be controlled. However, resistance to DDT has since developed, and bed bugs have become a more prevalent concern.

**Bed Bug Subgenres:**

Bed bugs are often categorized into subgenres based on their appearance and behavior. The Big Bug subgenre, also known as the Insect Fear or Giant Insect subgenre, is characterized by very large insects that create a sense of fear and horror. In contrast, the Bug Subgenre, also known as the Insect Subgenre, features smaller, less threatening insects.

**Bed Bug Eradication:**

Bed bugs are difficult to exterminate, and their eggs can survive for up to a year in a warm environment. To prevent infestations, it is important to maintain a clean and tidy home, launder linens and bedding regularly, and seal gaps and cracks where bed bugs might enter. In some cases, professional exterminators may be necessary to control bed bug infestations.

**Conclusion:**

The 1950s were a time of significant change and progress, but they were also a time when bed bugs were thought to be under control. However, with the advent of modern pesticides and the development of resistance, bed bugs continue to be a scourge for many households today.
